

# Pseudocode

Algorithm: MultipleLinearRegression

Input:

$X$  (training data:  $n \times d$ )  
 $y$  (target values:  $n$ )  
 $\alpha$  (learning rate)  
 $T$  (number of iterations)

Output:

$w$  (weight vector)  
 $b$  (bias)

Initialize  $w = \text{zeros}(d)$

Initialize  $b = 0$

for  $i = 1$  to  $T$  do

$y_{\text{hat}} = X \cdot w + b$

$\text{error} = y_{\text{hat}} - y$

$dw = (1/n) \cdot X^T \cdot \text{error}$

$db = (1/n) \cdot \text{sum}(\text{error})$

$w = w - \alpha \cdot dw$

$b = b - \alpha \cdot db$

end for

return  $w, b$

# Python Code

```
import numpy as np

def multiple_linear_regression(X, y, alpha=0.01, iterations=1000):
    n, d = X.shape
    w = np.zeros(d)
    b = 0

    for _ in range(iterations):
        y_hat = np.dot(X, w) + b
```

```
error = y_hat - y

dw = (1 / n) * np.dot(X.T, error)
db = (1 / n) * np.sum(error)

w = w - alpha * dw
b = b - alpha * db

return w, b
```
